WORK EXPERIENCE

SRE Engineer

SberBank
since 11/2025

- **Engineered an automated** AI-powered log analysis agent integrated with the observability stack (ELK/Prometheus), accelerating root-cause analysis (RCA) and reducing incident triage time by 40%.
- **Architected and standardized** Helm charts and CI/CD deployment pipelines for mission-critical enterprise services (GitLab, Jira, Confluence, Nexus) in Kubernetes/OpenShift, ensuring 99.9% availability for 3,000+ active users.
- **Refactored and modularized** the Nextcloud Helm chart codebase, cutting total configuration volume by 60% (from 25k to 10k LoC) while maintaining 100% functional parity and eliminating deployment configuration drift.
- **Tuned** NGINX ingress/load-balancer configurations (connection pooling, timeouts, buffering) and developed custom patches for the Harbor container registry, resolving production bottlenecks and improving artifact pull stability under peak loads.

DevOps Engineer

Excelsior at Huawei
03/2025 - 07/2025

- **Redesigned and modularized** complex GitLab CI/CD pipelines for systems development, reducing average build and test execution time by 30% through stage parallelization and artifact caching.
- **Standardized and hardened** GitLab Runner fleet configurations across Linux build nodes, eliminating flaky infrastructure failures and simplifying runner provisioning.
- **Implemented** automated pipeline templates and quality gates, accelerating feature delivery for the core engineering team.

Linux Systems Researcher / Intern

Excelsior at Huawei
09/2024 - 01/2025

- **Conducted** deep-dive systems research into Linux kernel internals, focusing on task scheduling (CFS), Virtual File System (VFS), system calls, and process memory management.
- **Analyzed and benchmarked** kernel-level resource isolation and containerization primitives (namespaces, cgroups, seccomp) to evaluate runtime performance and overhead.

PROJECTS

Sentix – Real-Time Market Sentiment Pipeline

Architected a microservice pipeline in Go (concurrent data ingestion) and Python for real-time crypto/financial news analysis, using OpenAI API inference backed by PostgreSQL and Docker Compose.

BrickOS

Custom x86 operating system kernel written from scratch in C and x86 Assembly featuring hardware interrupt handling and memory management.

EDUCATION

Mathematics and Computer Science

System Programming

Novosibirsk State University
Mechanics and Mathematics Faculty, Bachelor
2022 - 2026

RESEARCH

Using Neuro-Evolutional algorithms for modelling cognitive agents

Published at ISSC 2026 (p. 168). Demonstrated agent performance gain in noisy environments using NEAT over Deep Q-Networks (DQN).

SKILLS

Linux
Algorithms and Data Structures
GitLab CI/CD
Git & GitHub
C, C++, Go, Python
Computer Networks
Docker, K8s, OpenShift, Helm, Kustomize, NGINX
PostgreSQL
Grafana, Prometheus, ELK

LANGUAGES

Russian – Native
English – B2
